

EXPERIMENT 12: THE THEORY OF SMALL GIRLS

(Department of Endurance Studies, 2025)

Nosawema Emmanuella Ogboghodo

Hypothesis:

Every cell remembers the wound.
 → Test subject: girls.
 → Observation: their bodies, small archives of men's hypotheses.

Method:

Someone decided pain could be inherited
 and passed it down like family land.
 Note: trauma replicates faster than mercy.

Trial 1:

At ten, her pelvis is still cartilage—
 bones soft with unspent girlhood—
 yet a man kneels between her thighs
 and calls it marriage.
 Result: The body can split and still be called whole.

Trial 2:

An eleven-year-old pushes a child out of herself.
 Uterus folds like a lab notebook.
 Midwife murmurs "*well done*."
 Outcome: anomaly normalized as miracle.

Observation:

Every month, blood arrives uninvited—
 a periodic table of grief.
 We measure survival in millilitres,
 in the ratio of silence : scream.

Cultural Notes:

A priest says: "*This is our culture*."
 A father says: "*God knows best*."
 File name: "Female endurance_approved_v6."

Mutation Recorded:

Cells begin to rebel.
 They are remembering sunlight, rewriting the code.
 Subject refuses replication.
 Her voice spills like acid on tradition.
 She names herself equation, solution.
 Fire.

Conclusion:

Data incomplete.
 The experiment continues.
